Period 1

Mr. Henrichsen

12/4/18

There are many different kinds of code. Languages totally different from each other and from our own. Although some are actually quite similar to ours. Like Block Code, Block Code is one of the most simplistic languages because it is the least abstract from English. Other languages like Swift and Byte code are (compared to other coding languages) still close to english but share a lot more of the same lingo as Java and such. Then we get a lot further from english. Logic Gates start to go from more of a language to computational thinking. Like how the computer thinks, and Binary that goes to having no sense of words. Instead using ones and zeros to represent characters.
